

### Reldair Pro-Line System

This is the proven and well-known 120 bar system which is used in greenhouses and other applications all over the world. This system is praised because of the small droplet size and precise droplet distribution, where the droplets are equally distributed in the air and do not fall on your precious flowers or crops. The very fine and equal sized droplets create a fast evaporation and the adiabatic cooling creates a large cooling effect.

### Reldair Horti-Line System

This system combines the effective nozzle from the pro-line system with the easy to assemble horti-line tubing system. At an operation pressure of 100 bar this unique system delivers a very high price-value ratio.

### Typical systems in operation:
